LABOR FORCE IN IDAHO
1970 – 1977

THE LABOR FORCE IN IDAHO
AND
BASIC ECONOMIC DATA FOR IDAHO

SECTION I. THE STATE OF IDAHO
SECTION II. BY COUNTIES
SECTION III. BY MULTI-COUNTY LABOR MARKET AREAS

DEPARTMENT OF EMPLOYMENT
STATE OF IDAHO
JULIE M. KILGROW, DIRECTOR

Prepared by the
RESEARCH AND ANALYSIS BUREAU

INTRODUCTION

On the following pages are estimates of employment, unemployment, labor force, and the unemployment rate for all counties, labor market areas, and the State of Idaho. Each series is published by month for years 1970 through 1977. Data for only the State of Idaho are published for 1960 through 1977. These series have been compiled in response to the many requests for labor force information. This publication replaces all previous Labor Force in Idaho publications for these years.

Beginning in January 1989, the Department of Employment will shift to a new method of calculating monthly employment and unemployment data. The current building block method of estimation will be replaced with a regression model that will yield more precise estimates. Idaho's labor force data series will be revised using the new methodology back through 1978. This publication will contain historical labor force data that is not available using the new methodology, consequently there will be a series break between 1977 and 1978. Data from January 1978 forward will be available in subsequent Labor Force in Idaho publications.

Questions on the change in methodology may be directed to the Research and Analysis Bureau, Idaho Department of Employment, 317 Main Street, Boise, Idaho 83735 or call (208) 334-6168.

DEFINITIONS

Employment is made up of all wage and salary workers (including domestics and other private household workers), self-employed persons, and unpaid family workers who worked 15 hours or more during the survey week in family-operated enterprises. Employment in both agricultural and nonagricultural industries is included. Also included are persons temporarily absent from work because of illness, bad weather, vacations labor-management disputes, or because they were taking time off for various other reasons, even if they were not paid by their employers for the time off. Employed persons holding more than one job are counted only once. Commuters are shown at their place of residence and not at their place of work.

Unemployment includes all persons who did not work during the survey week, who made specific efforts to find a job, and who were able and available for work during the survey week. Also included as unemployed are those who were waiting to be called back to a job from which they had been laid off.

The **Civilian Labor Force** is the total of all civilians classified as employed or unemployed in accordance with the criteria described above.

The **Unemployment Rate** represents the number of unemployed as a percent of the civilian labor force.

The **Survey Week** is the week including the 12th of the month.

Seasonal Adjustment refers to the correction of an economic time series for regularly recurring seasonal movement which can be estimated on the basis of past experience. By eliminating that part of the change which can be ascribed the usual seasonal variations, it is possible to observe the cyclical and other nonseasonal movements in the series. However, in evaluating deviations from the seasonal pattern — that is, changes in a seasonally adjusted series — it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a broader margin of possible error than the original data on which they are based, since they are subject not only to sampling and other errors but, in addition, are affected by the uncertainties of the seasonal adjustment process itself. In the following pages data that have been seasonally adjusted are labeled "adjusted"; raw data are labeled "unadjusted."

LABOR FORCE IN IDAHO
1978 - 1984

THE LABOR FORCE IN IDAHO

SECTION I. THE STATE OF IDAHO
SECTION II. BY COUNTIES
SECTION III. BY MULTI-COUNTY LABOR MARKET AREAS

DEPARTMENT OF EMPLOYMENT
STATE OF IDAHO
JULIE M. KILGROW, DIRECTOR

Prepared by the
RESEARCH AND ANALYSIS BUREAU

INTRODUCTION

On the following pages are estimates of employment, unemployment, labor force, and the unemployment rate for all counties, labor market areas, and the State of Idaho. Each series is published by month for years 1978 through 1984. These series have been compiled in response to the many requests for labor force information. This publication replaces all previous Labor Force in Idaho publications for these years.

Beginning in January 1989, the Department of Employment will shift to a new method of calculating monthly employment and unemployment data. The current building block method of estimation will be replaced with a regression model that will yield more precise estimates. Idaho's labor force data series will be revised using the new methodology back through 1978. This publication contains the revised data for the years 1978 through 1984. As a result of the change in methodology, there will be a series break between 1977 and 1978. Data from January 1985 forward will be available in subsequent Labor Force in Idaho publications.

Questions on the change in methodology may be directed to the Research and Analysis Bureau, Idaho Department of Employment, 317 Main Street, Boise, Idaho 83735 or call (208) 334-6168.

DEFINITIONS

Employment is made up of all wage and salary workers (including domestics and other private household workers), self-employed persons, and unpaid family workers who worked 15 hours or more during the survey week in family-operated enterprises. Employment in both agricultural and nonagricultural industries is included. Also included are persons temporarily absent from work because of illness, bad weather, vacations, labor-management disputes, or because they were taking time off for various other reasons, even if they were not paid by their employers for the time off. Employed persons holding more than one job are counted only once. Commuters are shown at their place of residence and not at their place of work.

Unemployment includes all persons who did not work during the survey week, who made specific efforts to find a job, and who were able and available for work during the survey week. Also included as unemployed are those who were waiting to be called back to a job from which they had been laid off.

The **Civilian Labor Force** is the total of all civilians classified as employed or unemployed in accordance with the criteria described above.

The **Unemployment Rate** represents the number of unemployed as a percent of the civilian labor force.

The **Survey Week** is the week including the 12th of the month.

Seasonal Adjustment refers to the correction of an economic time series for regularly recurring seasonal movement which can be estimated on the basis of past experience. By eliminating that part of the change which can be ascribed the usual seasonal variations, it is possible to observe the cyclical and other nonseasonal movements in the series. However, in evaluating deviations from the seasonal pattern — that is, changes in a seasonally adjusted series — it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a broader margin of possible error than the original data on which they are based, since they are subject not only to sampling and other errors but, in addition, are affected by the uncertainties of the seasonal adjustment process itself. In the following pages data that have been seasonally adjusted are labeled "adjusted"; raw data are labeled "unadjusted."

LABOR FORCE IN IDAHO
1985 – 1988

NEW METHODOLOGY FOR ESTIMATING LABOR FORCE DATA

Beginning with data for January 1989, Idaho, in cooperation with the Bureau of Labor Statistics, will shift to a new method of calculating monthly employment and unemployment estimates. To replace the current building-block method, Idaho and the Bureau will begin to use a regression model that will yield more precise estimates and that will automatically adjust to structural changes in the state's economy.

BACKGROUND — Idaho has a contract with the Bureau of Labor Statistics to develop monthly estimates of the Civilian Labor Force for the state , the Boise MSA (Metropolitan Statistical Area), the other 43 counties, and cities of 25,000 population or more. Idaho is one of 39 states that develop these estimates, the remaining 11 states and the nation use data directly from the Current Population Survey (CPS). The CPS is a scientifically selected sample of households that are representative of the total population. The sample size in the 11 "direct use" states is large enough to produce reliable estimates on a monthly basis and thus are used as the official employment and unemployment series. For Idaho, the remaining 38 states, and the District of Columbia, the sample sizes are too small to support direct development of monthly estimates. For these states, which are referred to as "nondirect-use" states, the requirement for monthly labor force estimates has presented special problems.

Currently, labor force estimates for the nondirect-use states are prepared by first using a building-block approach defining and estimating components of unemployment and employment. This method relies on monthly data from the unemployment insurance (UI) system and the Current Employment Statistics (CES) program covering nonagricultural payroll employment. Estimates for groups not adequately measured monthly are developed, using historical or larger-area relationships. The estimates for unemployment so developed, because they are based on data from UI programs which differ from state to state, are not comparable across states. In order to ensure comparability across states and with the national measures — a requirement for purposes of analysis and equity in the distribution of federal funds — the monthly estimates for each state are adjusted to the CPS levels for the state using 6-month moving average of CPS data. Once annual average CPS data was available, the monthly employment and unemployment estimates for the year were then adjusted to these benchmark numbers, using a mathematical approach to distribute the difference between the CPS annual average and the average of the estimates prepared by the building-block procedure.

This methodology for developing monthly employment and unemployment estimates for Idaho, the other 38 nondirect-use states, and the District of Columbia for which monthly CPS estimates cannot be made has been deficient in a number of respects. The relatively small proportion of the total unemployed accounted for by UI claimants and difficulties in estimating groups not covered by UI cause the building-block estimates to significantly underestimate CPS levels. In addition, the method of benchmarking the series to the annual average results in discontinuities between the December benchmarked estimate and the January estimate prepared using the moving average.

Idaho chose to publish two sets of labor force data. One was the "official" data that was used for revenue sharing purposes. This data was based on an inadequate sample for Idaho and the benchmarking procedure changed the data frequently, which precluded development of an economic series. The second was the "handbook" data, the information compiled from the building block approach before being adjusted by the six-month moving average. This data reflected the changes in Idaho's economy more accurately and developed an economic series which allowed month-to-month and year-to-year comparisons.

NEW METHOD — Given the problems with the procedures just described, the 39 nondirect-use states in cooperation with BLS will replace the estimating methodology with a new method beginning with estimates of January 1989. The new methodology uses variable coefficient regression models developed for each individual state by BLS and tested by the states. Idaho's Research and Analysis Bureau has spent the last 18 months testing and revising their regression model so that it would reflect Idaho's economy. These dynamic time series regression models are able to use CPS, CES, and UI data in a more accurate and reliable manner. Over 10 years of data from these sources have been collected to build regression models that are resistant to large random sample errors in the CES and are flexible enough to reflect the individual features of each state's economy. While based on past relationships, the models have a built-in self-tuning mechanism that allows them to reflect structural changes in a state's economy as the changes occur. Two estimating equations are used for each state; one for employment and one for the unemployment rate.

The employment model uses the CES estimate of nonagricultural wage and salary jobs and data from the CES on employed persons not included in the CPS survey. The latter includes agricultural workers, and self-employed, unpaid family, and private household workers. In some states, seasonal variables are used to reflect CES/CPS differences such as the treatment of persons on unpaid absences.

The unemployment model uses data on UI claimants who have no earnings from employment to represent most of the experienced unemployed. An employment-to-population ratio is used to reflect both the business cycle and the experienced unemployed not covered by the UI data. A variable is used to represent unemployed new entrants and reentrants to the labor force. In Idaho, a seasonal entrant factor is used to show the labor force increase which occurs at the end of the school year.

An important feature of both models is that they automatically adjust to structural change. The models include a mechanism which revises an equation's coefficients when the new CPS data become available each month, if, given the estimate of error in the state CPS data, it is determined that changes in the underlying relationship have occurred.

County labor force data will continue to be estimated using the building-block approach. Research is continuing on a regression model for county data. Once the state data has been calculated using the regression model, the county data will be adjusted to the state data for additivity.

The new series will be seasonally adjusted. Prior to the new methodology, BLS data could not be seasonally adjusted. Both the state and county data will be available each month on an adjusted and unadjusted basis.

SUMMARY — Beginning with data for January 1989, Idaho will use a new estimating methodolody to develop monthly labor force estimates. Known as the variable coefficient model approach, the new method will produce estimates which more accurately represent the month-to-month changes in statewide employment/unemployment and which better reflect seasonal patterns. The new labor force data will be the best data available at that point in time.

S22 30-1

INTRODUCTION

On the following pages are estimates of employment, unemployment, labor force, and the unemployment rate for all counties, labor market areas, and the State of Idaho. Each series is published by month for years 1985 through 1988. These series have been compiled in response to the many requests for labor force information. This publication replaces all previous Labor Force in Idaho publications for these years.

Beginning in January 1989, the Department of Employment will shift to a new method of calculating monthly employment and unemployment data. The current building block method of estimation will be replaced with a regression model that will yield more precise estimates. Idaho's labor force data series will be revised using the new methodology back through 1978. This publication contains labor force data using the new methodology. Data in this publication is subject to revision and the final labor force data will be available in subsequent Labor Force in Idaho publications.

Questions on the change in methodology may be directed to the Research and Analysis Bureau, Idaho Department of Employment, 317 Main Street, Boise, Idaho 83735 or call (208) 334-6168.

DEFINITIONS

Employment is made up of all wage and salary workers (including domestics and other private household workers), self-employed persons, and unpaid family workers who worked 15 hours or more during the survey week in family-operated enterprises. Employment in both agricultural and nonagricultural industries is included. Also included are persons temporarily absent from work because of illness, bad weather, vacations, labor-management disputes, or because they were taking time off for various other reasons, even if they were not paid by their employers for the time off. Employed persons holding more than one job are counted only once. Commuters are shown at their place of residence and not at their place of work.

Unemployment includes all persons who did not work during the survey week, who made specific efforts to find a job, and who were able and available for work during the survey week. Also included as unemployed are those who were waiting to be called back to a job from which they had been laid off.

The **Civilian Labor Force** is the total of all civilians classified as employed or unemployed in accordance with the criteria described above.

The **Unemployment Rate** represents the number of unemployed as a percent of the civilian labor force.

The **Survey Week** is the week including the 12th of the month.

Seasonal Adjustment refers to the correction of an economic time series for regularly recurring seasonal movement which can be estimated on the basis of past experience. By eliminating that part of the change which can be ascribed the usual seasonal variations, it is possible to observe the cyclical and other nonseasonal movements in the series. However, in evaluating deviations from the seasonal pattern — that is, changes in a seasonally adjusted series — it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a broader margin of possible error than the original data on which they are based, since they are subject not only to sampling and other errors but, in addition, are affected by the uncertainties of the seasonal adjustment process itself. In the following pages data that have been seasonally adjusted are labeled "adjusted"; raw data are labeled "unadjusted."
